### **DETAILED ACTION**

1. The cancellation of claims 16-63 in Paper filed on 03/28/2005 is acknowledged.

2. Claims 1-15 are pending in the Application

#### Continued Examination Under 37 CFR 1.114

3. A request for continued examination under 37 CFR 1.114 was filed in this application after a decision by the Board of Patent Appeals and Interferences, but before the filing of a Notice of Appeal to the Court of Appeals for the Federal Circuit or the commencement of a civil action. Since this application is eligible for continued examination under 37 CFR 1.114 and the fee set forth in 37 CFR 1.17(e) has been timely paid, the appeal has been withdrawn pursuant to 37 CFR 1.114 and prosecution in this application has been reopened pursuant to 37 CFR 1.114. Applicant's submission filed on 03/28/2005 has been entered.

# Claim Rejections - 35 USC § 103

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 5. Claims 1, 3-5, 7-11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Xu et al. (U.S. 5,847,461, hereinafter Xu '461) in view of Xu et al. (U.S. 6,217,721, hereinafter Xu '721).

Xu '461 (Figs.1-4) in a related method to form an interconnect teach forming a recess (14) within a dielectric material (10) situated on a semiconductor substrate (2),

wherein said recess (14) extends below a top surface (12) of said dielectric material (10); forming a diffusion barrier layer (20) comprising titanium nitride conformally on the top surface of the dielectric material (10) and over an interior surface of the recess (14); forming an electrically conductive layer (30) comprising aluminum on the barrier layer (20) and over the top surface of the dielectric material (10), wherein the diffusion barrier layer (20) has a melting point greater than that of the electrically conductive layer (30); forming an energy absorbing layer (40) on said electrically conductive layer (30), wherein said energy absorbing layer (40) has a greater thermal absorption capacity than that of said electrically conductive layer (30) and wherein said energy absorbing layer (40) is selected from the group consisting of titanium, tungsten, silicon dioxide and tantalum; using a furnace to apply energy omnidirectionally to said energy absorbing layer (40) causing said electrically conductive layer (30) to flow within said recess (14): and removing portions of the energy absorbing layer (40) and the electrically conductive layer (30) that are situated above the top surface of the dielectric material (10) (column 3, line 12 – column 7, line 45).

Page 3

Xu '461 fail to teach the steps of heating the diffusion barrier layer in an environment substantially containing nitrogen gas; forming a seed layer comprising titanium nitride on the diffusion barrier layer and over the dielectric material, wherein the diffusion barrier layer has a melting point greater than or equal to the seed layer; forming an electrically conductive layer on the seed layer including the portion of the seed layer within said recess, wherein the seed layer has a melting point greater than or equal to that of the electrically conductive layer.

However, Xu '721 (Fig.8) in a related method to form an interconnect teach the steps of heating a diffusion barrier layer (162) in an environment substantially containing nitrogen gas; forming a seed layer (164) comprising titanium nitride on a diffusion barrier layer (164) and over a dielectric material layer (142), wherein the diffusion barrier layer (162) has a melting point greater than or equal to that of the seed layer (164); and forming an electrically conductive layer (156) on the seed layer (164) including the portion of the seed layer (164) within a recess (152), wherein the seed layer (164) has a melting point greater than or equal to that of the electrically conductive layer (156) (column 3, line 65 – column 6, line 45).

Although Xu '461 teaches adverse effects that could happen by using a tungsten seed layer (Xu '461, column 1, line 63 – column 2, line 27), Xu '461 is silent on the use of other seed layers and thus is open to use the titanium nitride layer disclosed by Xu '721.

Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention was made to form a seed layer after the formation of the barrier layer and prior to the formation of the conductive layer, and having the thermal properties as taught by Xu '721 in the interconnect formation method of Xu '461, since heating the barrier layer in a nitrogen environment substantially reduces the electronic barrier at the metal-semiconductor interface (column 9, lines 39-45) and the addition of titanium nitride as a seed layer improves the flow of aluminum into an interconnect at moderate temperatures (column 6, lines 40-45).

Art Unit: 2823

6. Claims 2, 6 and 12-15 rejected under 35 U.S.C. 103(a) as being unpatentable over Xu '461 in view of Xu '721 as applied to claims 1, 3-5, 7-11 and 36- 45 above, and further in view of Yim (U.S. 5,869,395).

Xu '461 in combination with Xu '721 substantially teach all aspects of the invention but fail to teach that the diffusion barrier layer and the seed layer are deposited on the recess by a chemical vapor deposition process; that a chemical-mechanical polishing is used to remove portions of the energy absorbing layer and the electrically conductive layer; that the recess has an aspect ratio greater that about four to one; and that the recess comprises a contact hole situated below a trench, wherein said semiconductor substrate has a lower substrate and terminates at an opposite end thereof at said trench, and wherein said trench extends from said opposite end of said contact hole to a top surface of said dielectric material and parallel to the plane of the lower substrate.

However, Yim (Figs.2A-2K) in a related method to form an interconnect structure teaches the steps of depositing titanium nitride by a chemical vapor deposition process; using chemical-mechanical polishing to remove portions overlaying a damascene trench formed on a dielectric layer (210); providing a recess comprising a contact hole (260) situated below a trench (240); providing a semiconductor substrate (200) having a lower substrate (202) and terminating at an opposite end thereof at said trench (240), wherein said trench (240) extends from said opposite end of said contact hole (260) to a top surface of said dielectric material (210), and parallel to the plane of the lower substrate (202) (column 4, line 26 – column 7, line 31). Therefore, it would have been obvious to

Application/Control Number: 08/801,812

Art Unit: 2823

one of ordinary skill in the art at the time of the invention was made to deposit titanium nitride by chemical vapor deposition, using chemical mechanical polish to remove portions of conductive material overlying the dielectric layer and forming a recess comprising a trench and a contact hole as taught by Yim in the interconnect method of Xu '461 and Xu '721, since this would result in a damascene opening with an alignment tolerance, reduced processing time and a flat topography (column 3, line 49 – column 4, line 5).

Still, the combination of Xu '461 Xu '721 and Yim fail to teach that the recess has an aspect ratio greater than about four to one. However, one of ordinary skill in the art at the time the invention was made would have been led to the claimed invention through routine experimentation to achieve desired device dimensions and therefore desired device density and desired device characteristics on the finished wafer. Also, it would have been an obvious matter of design choice bounded by well known manufacturing constraints and ascertainable by routine experimentation and optimization to choose these particular dimensions because applicant has not disclosed that the dimensions are for a particular unobvious purpose, produce an unexpected result, or are otherwise critical, and it appears prima facie that the process would possess utility using another dimension. Indeed, it has been held that mere dimensional limitations are prima facie obvious absent a disclosure that the limitations are for a particular unobvious purpose, produce an unexpected result, or are otherwise critical. See, for example, In re Rose, 220 F.2d 459, 105 USPQ 237 (CCPA 1955); In re Rinehart, 531 F.2d 1048, 189 USPQ 143 (CCPA 1976); Gardner v. TEC Systems, Inc.,
